Is this a bug?

```
for (int i = 0; i <= (2^32) - 1; i++) {
```

from: John Regehr (on Twitter)

Execution Debugging

Assertions

An Assertion is a statement to detect a violated assumption. An assertions represents an *invariant* in the code

Error/Exception can indicate “exceptional” conditions (invalid user input, missing files, etc.)

- **Exceptions** are more robust but slower
- **Error** are fast but difficult to handle in complex programs

```
#include <cassert> // <-- needed
int sqrt(int value) {
    int ret = sqrt_internal(value);
    assert(ret >= 0 && (ret == 0 || ret == 1 || ret < value));
    return ret;
}
```

Assertions may slow down the execution. They can be disabled by defining the **NDEBUG** macro

```
#define NDEBUG // or at compile-time with "-DNDEBUG"
```

Execution Debugging (gdb)

How to compile and run for debugging:

```
g++ -g [-ggdb3] <program.cpp> -o program
gdb [--args] ./program <args...>
```

-g Enable debugging

- stores the *symbol table information* in the executable (mapping between assembly and source code lines)
- for some compilers, it may disable certain optimizations
- slow down the compilation phase

-ggdb3 Produces debugging information specifically intended for gdb

- the last number produces extra debugging information, for example: including macro definitions
- in general, it is not portable across different compiler (supported by gcc, clang)

`gdb` - Breakpoints/Watchpoints

Command	Abbr.	Description
<code>breakpoint <file>:<line></code>	<code>b</code>	insert a breakpoint in a specific line
<code>breakpoint <function_name></code>	<code>b</code>	insert a breakpoint in a specific function
<code>breakpoint <ref> if <condition></code>	<code>b</code>	insert a breakpoint with a conditional statement
<code>delete</code>	<code>d</code>	delete all breakpoints or watchpoints
<code>delete <breakpoint_number></code>		delete a specific breakpoint
<code>clear [function_name/line_number]</code>		delete a specific breakpoint
<code>enable/disable <breakpoint_number></code>		enable/disable a specific breakpoint
<code>watch <expression></code>		stop execution when the value of expression changes (variable, comparison, etc.)

gdb - Control Flow

Command	Abbr.	Description
<code>run [args]</code>	<code>r</code>	run the program
<code>continue</code>	<code>c</code>	continue the execution
<code>finish</code>	<code>f</code>	continue until the end of the current function
<code>step</code>	<code>s</code>	execute next line of code (follow function calls)
<code>next</code>	<code>n</code>	execute next line of code
<code>until <program_point></code>		continue until reach line number, function name, address, etc.
<code>CTRL+C</code>		stop the execution (not quit)
<code>quit</code>	<code>q</code>	exit

gdb - Stack and Info

Command	Abbr.	Description
<code>list</code>	<code>l</code>	print code
<code>list <function or #start,#end></code>	<code>l</code>	print function/range code
<code>up</code>	<code>u</code>	move up in the call stack
<code>down</code>	<code>d</code>	move down in the call stack
<code>backtrace</code>	<code>bt</code>	prints stack backtrace (call stack)
<code>backtrace <full></code>	<code>bt</code>	print values of local variables
<code>help [<command>]</code>	<code>h</code>	show help about command
<code>info <args/breakpoints/ watchpoints/registers/local></code>		show information about program arguments/breakpoints/watchpoints/ registers/local variables

Command	Abbr.	Description
<code>print <variable></code>	<code>p</code>	print variable
<code>print/h <variable></code>	<code>p/h</code>	print variable in hex
<code>print/nb <variable></code>	<code>p/nb</code>	print variable in binary (<code>n</code> bytes)
<code>print/w <address></code>	<code>p/w</code>	print address in binary
<code>p /s <char array/address></code>		print char array
<code>p *array_var@n</code>		print <code>n</code> array elements
<code>p (int[4])<address></code>		print four elements of type <code>int</code>
<code>p *(char*)&<std::string></code>		print <code>std::string</code>

Command	Description
<code>disassemble <function_name></code>	disassemble a specified function
<code>disassemble <0xStart,0xEnd addr></code>	disassemble function range
<code>nexti <variable></code>	execute next line of code (follow function calls)
<code>stepi <variable></code>	execute next line of code
<code>x/nfu <address></code>	examine address n number of elements, f format (d : int, f : float, etc.), u data size (b : byte, w : word, etc.)

The debugger automatically stops when:

- breakpoint (by using the debugger)
- assertion fail
- segmentation fault
- trigger software breakpoint (e.g. SIGTRAP on Linux)
github.com/scottt/debugbreak

(it also contains a script to *de-referencing* STL Containers)

[gdb reference card V5 link](#)

Memory Debugging

“70% of all the vulnerabilities in Microsoft products are memory safety issues”

***Matt Miller**, Microsoft Security Engineer*

Terms like *buffer overflow*, *race condition*, *page fault*, *null pointer*, *stack exhaustion*, *heap exhaustion/corruption*, *use-after-free*, or *double free* – all describe **memory safety vulnerabilities**

valgrind is a tool suite to automatically detect many memory management and threading bugs

Website: valgrind.org

How to install the last version:

```
$ wget ftp://sourceware.org/pub/valgrind/valgrind-3.15.0.tar.bz2
$ tar xf valgrind-3.15.0.tar.bz2
$ cd valgrind-3.15.0
$ ./configure --enable-lto
$ make -j 12
$ sudo make install
$ sudo apt install libc6-dbg
```

Basic usage:

- compile with `-g`

- `$ valgrind ./program <args...>`

Output example 1:

```
==60127== Invalid read of size 4                !!out-of-bound access
==60127==    at 0x100000D9E: f(int) (test01.C:86)
==60127==    by 0x100000C22: main (test01.C:40)
==60127== Address 0x10042c148 is 0 bytes after a block of size 40 alloc'd
==60127==    at 0x1000161EF: malloc (vg_replace_malloc.c:236)
==60127==    by 0x100000C88: f(int) (test01.C:75)
==60127==    by 0x100000C22: main (test01.C:40)
```

Output example 2:

```
!!memory leak
==19182== 40 bytes in 1 blocks are definitely lost in loss record 1 of 1
==19182==    at 0x1B8FF5CD: malloc (vg_replace_malloc.c:130)
==19182==    by 0x8048385: f (a.c:5)
==19182==    by 0x80483AB: main (a.c:11)

==60127== HEAP SUMMARY:
==60127==    in use at exit: 4,184 bytes in 2 blocks
==60127==    total heap usage: 3 allocs, 1 frees, 4,224 bytes allocated
==60127==
==60127== LEAK SUMMARY:
==60127==    definitely lost: 128 bytes in 1 blocks    !!memory leak
==60127==    indirectly lost: 0 bytes in 0 blocks
==60127==    possibly lost: 0 bytes in 0 blocks
==60127==    still reachable: 4,184 bytes in 2 blocks  !!not deallocated
==60127==    suppressed: 0 bytes in 0 blocks
```

Advanced flags:

- `--leak-check=full` print details for each “definitely lost” or “possibly lost” block, including where it was allocated
- `--show-leak-kinds=all` to combine with `--leak-check=full`.
Print all leak kinds
- `--track-fds=yes` list open file descriptors on exit (not closed)
- `--track-origins=yes` tracks the origin of uninitialized values
(very slow execution)

```
valgrind --leak-check=full --show-leak-kinds=all  
        --track-fds=yes --track-origins=yes ./program <args...>
```

Track stack usage:

```
valgrind --tool=drd --show-stack-usage=yes ./program <args...>
```

Sanitizers

Sanitizers are compiler-based instrumentation components to perform *dynamic* analysis

Sanitizer are used during development and testing to discover and diagnose memory misuse bugs and potentially dangerous undefined behavior

Sanitizer are implemented in **Clang** (from 3.1), **gcc** (from 4.8) and **Xcode**

Project using Sanitizers:

- Chromium
- Firefox
- Linux kernel
- Android

Address Sanitizer

Address Sanitizer is a memory error detector

- heap/*stack/global* out-of-bounds
- memory leaks
- use-after-free, use-after-return, use-after-scope
- double-free, invalid free
- initialization order bugs
- etc.
- * Similar to `valgrind` but faster (2X slowdown)

```
clang++ -O1 -g -fsanitize=address -fno-omit-frame-pointer <program>
```

`-O1` disable inlining

`-g` generate symbol table

Website:

clang.llvm.org/docs/AddressSanitizer.html

github.com/google/sanitizers/wiki/AddressSanitizer

gcc.gnu.org/onlinedocs/gcc/Instrumentation-Options.html

Leak Sanitizer

LeakSanitizer is a run-time *memory leak* detector

- integrated into AddressSanitizer, can be used as standalone tool
- * almost no performance overhead until the very end of the process

```
g++      -O1 -g -fsanitize=address -fno-omit-frame-pointer <program>  
clang++ -O1 -g -fsanitize=leak -fno-omit-frame-pointer <program>
```

Website:

clang.llvm.org/docs/LeakSanitizer.html

github.com/google/sanitizers/wiki/AddressSanitizerLeakSanitizer

gcc.gnu.org/onlinedocs/gcc/Instrumentation-Options.html

Memory Sanitizers

Memory Sanitizer is detector of *uninitialized* reads

- stack/heap-allocated memory read before it is written
- * Similar to valgrind but faster (3X slowdown)

```
clang++ -O1 -g -fsanitize=memory -fno-omit-frame-pointer <program>
```

```
-fsanitize-memory-track-origins=2  
  track origins of uninitialized values
```

Note: not compatible with Address Sanitizer

Website:

```
clang.llvm.org/docs/MemorySanitizer.html  
github.com/google/sanitizers/wiki/MemorySanitizer  
gcc.gnu.org/onlinedocs/gcc/Instrumentation-Options.html
```

Undefined Behavior Sanitizer

UndefinedBehaviorSanitizer is a *undefined behavior* detector

- signed integer overflow, floating-point types overflow, enumerated not in range
- out-of-bounds array indexing, misaligned address
- divide by zero
- etc.
- * Not included in valgrind

```
clang++ -O1 -g -fsanitize=undefined -fno-omit-frame-pointer <program>
```

`-fsanitize=integer` Checks for undefined or suspicious integer behavior (e.g. unsigned integer overflow)

`-fsanitize=nullability` Checks passing null as a function parameter, assigning null to an lvalue, and returning null from a function

Website:

clang.llvm.org/docs/UndefinedBehaviorSanitizer.html

gcc.gnu.org/onlinedocs/gcc/Instrumentation-Options.html

Debugging Summary

How to Debug Common Errors

Segmentation fault

- gdb
- valgrind
- Segmentation fault when just entered in a function → stack overflow

Double free or corruption

- gdb
- valgrind

Infinite execution

- gdb + (CTRL + C)

Incorrect results

- valgrind + assertion + gdb + UndefinedBehaviorSanitizer

Demangling

Name mangling is a technique used to solve various problems caused by the need to resolve unique names

Transforming C++ ABI (Application binary interface) identifiers into the original source identifiers is called **demangling**

Example (linking error):

```
_ZNSt13basic_filebufIcSt11char_traitsIcEED1Ev
```

After demangling:

```
std::basic_filebuf<char, std::char_traits<char> >::~~basic_filebuf()
```

How to demangle:

- `make |& c++filt | grep -P '`.*(?=?=)`'`
- Online Demangler: <https://demangler.com>

CMake

CMake Overview

CMake is an *open-source*, *cross-platform* family of tools designed to build, test and package software

Website: <https://cmake.org>

CMake is used to control the software compilation process using simple platform and compiler independent configuration files, and *generate* native Makefile/Ninja and workspaces that can be used in the compiler environment of your choice

CMake features:

- Turing complete language
- Multi-platform (Windows, Linux, etc.)
- Open-Source
- Generate: `makefiles`, `ninja`, etc.
- Supported by many IDE: Visual Studio, Eclipse, etc.

- 19 reasons why CMake is actually awesome
- An Introduction to Modern CMake
- Useful Variables
- Modern CMake is like inheritance
- Effective Modern CMake
- CMake Useful Variables

CMakeLists.txt minimal example:

```
project(my_project)           # project name

add_executable(program program.cpp) # compile command
```

```
$ cmake .      # CMakeLists.txt directory
$ make         # makefile automatically generated
```

Scanning dependencies of target program

[100%] Building CXX object CMakeFiles/out_program.dir/program.cpp.o

Linking CXX executable program

[100%] Built target program

```
project(my_project) # project name
cmake_minimum_required(VERSION 3.15) # minimum version

set(CMAKE_CXX_STANDARD 14) # force C++14
set(CMAKE_CXX_STANDARD_REQUIRED ON)
set(CMAKE_CXX_EXTENSIONS OFF)

add_executable(program)

# indicate include directory
target_include_directories(program
    PUBLIC "${PROJECT_SOURCE_DIR}/include")

# find all .cpp file in src/ directory
file(GLOB_RECURSE SRCS "${PROJECT_SOURCE_DIR}/src/*.cpp")
# compile all *.cpp file
target_sources(program PRIVATE ${SRCS})
```

```
project(my_project)                # project name
cmake_minimum_required(VERSION 3.15) # minimum version

add_executable(program)

if (CMAKE_BUILD_TYPE STREQUAL "Debug") # "Debug" mode
    target_compile_options(program "-g")
    target_compile_options(program "-O1")
    if (CMAKE_COMPILER_IS_GNUCXX) # if compiler is gcc
        target_compile_options(program "-ggdb3")
    endif()
elseif (CMAKE_BUILD_TYPE STREQUAL "Release") # "Release" mode
    target_compile_options(program "-O2")
endif()

target_sources(program PRIVATE program.cpp)
```

```
$ cmake -DCMAKE_BUILD_TYPE=Debug .
```

```
project(my_project)                # project name
cmake_minimum_required(VERSION 3.15) # minimum version

add_custom_target(rm                # makefile target name
                  COMMAND rm -rf *.o # real command
                  COMMENT "Clear build directory")

add_executable(program)

find_package(Boost 1.36.0 REQUIRED) # compile only if Boost library
                                   # is found

if (Boost_FOUND)
    target_include_directories("${PROJECT_SOURCE_DIR}/include"
                              PUBLIC ${Boost_INCLUDE_DIRS})
else()
    message(FATAL_ERROR "Boost Lib not found")
endif()

target_sources(program PRIVATE program.cpp)
```

```
$ cmake .
$ make rm
```

Generate JSON compilation database (`compile_commands.json`)

It contains the exact compiler calls for each file (used by other tools)

```
project(my_project)           # project name
cmake_minimum_required(VERSION 3.15) # minimum version

set(CMAKE_EXPORT_COMPILE_COMMANDS ON) # <--

add_executable(program)
target_sources(program PRIVATE program.cpp)
```

Change the compiler:

```
CC=gcc CXX=g++ cmake .
```

Code Checking and Analysis

Compiler Warnings

Enable specific warnings:

```
g++ -W<warning> <args...>
```

Disable specific warnings:

```
g++ -Wno-<warning> <args...>
```

Common warning flags to minimize accidental mismatches:

-Wall Enables many standard warnings (~50 warnings)

-Wextra Enables some extra warning flags that are not enabled by
-Wall (~15 warnings)

-Wpedantic Issue all the warnings demanded by strict ISO C/C++

Enable ALL warnings (only clang) **-Weverything**

GCC Warnings

Additional GCC warning flags (≥ 5.0):

```
-Wcast-align
-Wcast-qual
-Wconversion
# -Wfloat-conversion
# -Wsign-conversion
-Wdate-time
-Wdouble-promotion
-Weffc++
# -Wdelete-non-virtual-dtor
# -Wnon-virtual-dtor
-Wformat-signedness
-Winvalid-pch
-Wlogical-op
-Wmissing-declarations
-Wmissing-include-dirs
-Wodr
```

```
-Wold-style-cast
-Wpragmas
-Wredundant-decls
-Wshadow
-Wsign-promo*
-Wstrict-aliasing
-Wstrict-overflow=1 # 5
-Wswitch-bool
# -Wswitch-default
# -Wswitch-enum
-Wtrampolines
-Wunused-macros
-Wuseless-cast
-Wvla
-Wformat=2
-Wno-long-long
```

GCC Warnings

Additional GCC warning flags (≥ 8.0):

```
-Wcatch-value=2  
-Wextra-semi  
-Wstringop-truncation  
-Wsuggest-attribute=cold  
-Wsuggest-attribute=malloc  
-Walloca  
-Wduplicated-branches  
-Wformat-overflow=2  
-Wformat-truncation=2  
-Wstringop-overflow=3  
-Wduplicated-cond  
-Wnull-dereference  
-Wplacement-new=2  
-Wshift-overflow=2
```

Full story:

gcc.gnu.org/onlinedocs/gcc/Warning-Options.html

github.com/barro/compiler-warnings

Static Analyzers - clang static analyzer

The Clang Static Analyzer is a source code analysis tool that finds bugs in C/C++ programs at compile-time

Website: clang-analyzer.llvm.org

It find bugs by reasoning about the semantics of code (may produce false positives)

Example:

```
void test() {  
    int i, a[10];  
    int x = a[i]; // warning: array subscript is undefined  
}
```

How to use:

```
scan-build make
```

scan-build is included in the LLVM suite

Static Analyzers - cppcheck

Cppcheck provides code analysis to detect bugs, undefined behavior and dangerous coding construct. The goal is to detect only real errors in the code (i.e. have very few false positives)

Website: cppcheck.sourceforge.net

```
cppcheck --enable=warning,performance,style,portability,information,error  
         <src_file/directory>
```

```
cmake -DCMAKE_EXPORT_COMPILE_COMMANDS=ON .  
cppcheck --enable=<enable_flags> --project=compile_commands.json
```

Static Analyzers - PVS-Studio/FBIinfer

PVS-Studio is a high-quality *proprietary* (free for open source projects) static code analyzer supporting C, C++

Website: www.viva64.com/en/pvs-studio

Customers: IBM, Intel, Adobe, Microsoft, Nvidia, Bosh, IdGames, EpicGames, etc.

FBIinfer is a static analysis tool (also available online) to checks for null pointer dereferencing, memory leak, coding conventions, unavailable APIs, etc.

Website: fbinfer.com

Customers: Amazon AWS, Facebook/Oculus, Instagram, Whatapp, Mozilla, Spotify, Uber, Sky, etc.

deepCode is an AI-powered code review system, with machine learning systems trained on billions of lines of code from open-source projects

Website: www.deepcode.ai

Available for Visual Studio Code and Atom

Code Quality

lint: The term was derived from the name of the undesirable bits of fiber

clang-tidy provides an extensible framework for diagnosing and fixing typical *programming errors*, like *style violations*, *interface misuse*, or *bugs* that can be deduced via static analysis

Website: clang.llvm.org/extra/clang-tidy

```
$cmake -DCMAKE_EXPORT_COMPILE_COMMANDS=ON .  
$clang-tidy -p .
```

clang-tidy searches the configuration file .clang-tidy file located in the closest parent directory of the input file

clang-tidy is included in the LLVM suite

Coding Guidelines:

- CERT Secure Coding Guidelines
- C++ Core Guidelines
- High Integrity C++ Coding Standard

Supported Code Conventions:

- Fuchsia
- Google
- LLVM

Bug Related:

- Android related
- Boost library related
- Misc
- Modernize
- Performance
- Readability
- clang-analyzer checks
- bugprone code constructors

.clang-tidy

```
Checks: 'android-*,boost-*,bugprone-*,cert-*,cppcoreguidelines-*,  
clang-analyzer-*,fuchsia-*,google-*,hicpp-*,llvm-*,misc-*,modernize-*,  
performance-*,readability-*
```

Linters -vera++

Vera++ is tool for verification and analysis of C++ source code. It is complementary to `clang-tidy`: It provides weaker checkers, more oriented to syntax, then semantic

- well-formed file names
- space rules
- variable names
- etc.

Website: bitbucket.org/verateam/vera/wiki/Home

```
vera++ --rule <rule_list> <src_file/include_file>
```

```
vera++ --profile <profile_name> <src_file/include_file>
```

Code Testing

CTest is a testing tool (integrated in CMake) that can be used to automate updating, configuring, building, testing, performing memory checking, performing coverage

```
project(my_project)
cmake_minimum_required(VERSION 3.5)
add_executable(program program.cpp)

enable_testing()

add_test(NAME Test1          # check if "program" returns 0
         WORKING_DIRECTORY ${PROJECT_SOURCE_DIR}/build
         COMMAND ./program <args>) # command can be anything

add_test(NAME Test2          # check if "program" print "Correct"
         WORKING_DIRECTORY ${PROJECT_SOURCE_DIR}/build
         COMMAND ./program <args>)

set_tests_properties(Test2
                     PROPERTIES PASS_REGULAR_EXPRESSION "Correct")
```

Basic usage (call ctest):

```
$make test      # run all tests
```

ctest usage:

```
$ctest -R Python      # run all tests that contains 'Python' string  
$ctest -E Iron        # run all tests that not contain 'Iron' string  
$ctest -I 3,5         # run tests from 3 to 5
```

Each ctest command can be combined with other tools (e.g. valgrind)

Unit Test

Unit testing involves breaking your program into pieces, and subjecting each piece to a series of tests

Unit Testing Benefits:

- Increases confidence in changing/ maintaining code
- The cost of fixing a defect detected during unit testing is lesser in comparison to that of defects detected at higher levels
- Debugging is easy. When a test fails, only the latest changes need to be debugged

C++ Unit testing frameworks:

- `catch-lib`
- `Google Test`
- `CppUnit`
- `Boost.Test`

Catch2 is a multi-paradigm test framework for C++

Website: catch-lib.net

Catch2 features

- Header only and no external dependencies
- Assertion macro
- Floating point tolerance comparisons

Basic usage:

- Create the test program
- Run the test

```
$. /test_program [<TestName>]
```

Other commands:

github.com/catchorg/Catch2

```
#define CATCH_CONFIG_MAIN // This tells Catch to provide a main()
#include "catch.hpp" // only do this in one cpp file

unsigned int Factorial(unsigned int number) {
    return number <= 1 ? number : Factorial(number - 1) * number;
}

float floatComputation() { ... }

"Test description and tag name"
TEST_CASE( "Factorials are computed", "[Factorial]" ) {
    REQUIRE( Factorial(1) == 1 );
    REQUIRE( Factorial(2) == 2 );
    REQUIRE( Factorial(3) == 6 );
    REQUIRE( Factorial(10) == 3628800 );
}

TEST_CASE( "floatCmp computed", "[floatComputation]" ) {
    REQUIRE( floatComputation() == Approx( 2.1 ) );
}
```

Code coverage is a measure used to describe the degree to which the source code of a program is executed when a particular test suite runs

gcov is a tool you can use in conjunction with GCC to test code coverage in programs

lcov is a graphical front-end for gcov. It collects gcov data for multiple source files and creates HTML pages containing the source code annotated with coverage information

Step for code coverage:

- compile with `--coverage` flag (objects + linking)
- run the test
- visualize the results with `gcov` or `lcov`

program.cpp:

```
#include <iostream>
#include <string>

int main(int argc, char* argv[]) {
    int value = std::stoi(argv[1]);
    if (value % 3 == 0)
        std::cout << "first\n";
    if (value % 2 == 0)
        std::cout << "second\n";
}
```

```
$gcc --std=c++11 --coverage program.cpp -o program
$./program 9
first
$gcov program.cpp
File 'program.cpp'
Lines executed:85.71% of 7
Creating 'program.cpp.gcov'
$lcov --capture --directory . --output-file coverage.info
$genhtml coverage.info --output-directory out
```

program.cpp.gcov:

```

1: 4:int main(int argc, char* argv[]) {
1: 5:     int value = std::stoi(argv[1]);
1: 6:     if (value % 3 == 0)
1: 7:         std::cout << "first\n";
1: 8:     if (value % 2 == 0)
#####: 9:         std::cout << "second\n";
4: 10:}

```

lcov output:

1	: #include <iostream>
2	: #include <string>
3	:
4	1: int main(int argc, char* argv[]) {
5	1: int value = std::stoi(argv[1]); // convert to int
6	1: if (value % 3 == 0)
7	1: std::cout << "first";
8	1: if (value % 2 == 0)
9	0: std::cout << "second";
10	4: }

Code Commenting

Doxygen is the de facto standard tool for generating documentation from annotated C++ sources

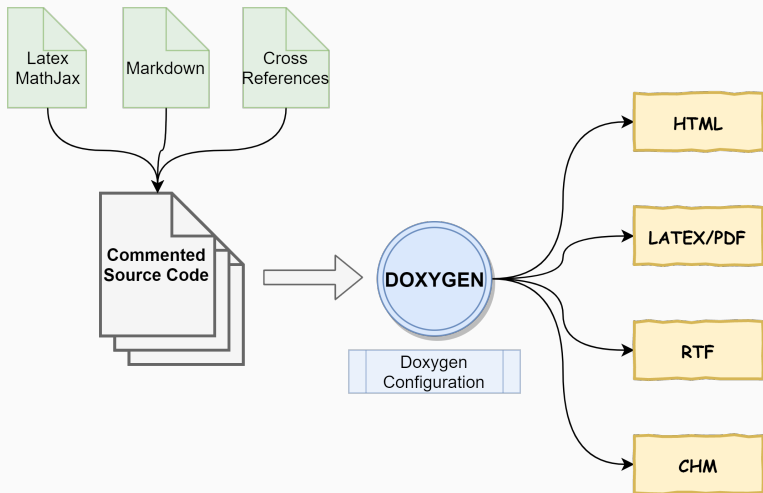

Doxygen usage

- comment the code with `///` or `/** comment */`
- generate doxygen base configuration file

```
$doxygen -g
```

- modify the configuration file `doxygen.cfg`
- generate the documentation

```
$doxygen <config_file>
```

Doxygen provides support for:

- **Latex/MathJax** Insert latex math `$<code>$`
- **Markdown** ([Markdown Cheatsheet link](#)) Italic text `*<code>*`, bold text `**<code>**`, table, list, etc.
- **Automatic cross references** Between functions, variables, etc.
- **Specific highlight** Code ``<code>``, parameter `@param <param>`

Doxygen guidelines:

- Include in every file **copyright, author, date, version**
- Comment namespaces and classes
- Comment template parameters
- Distinguish input and output parameters
- Call/Hierarchy graph can be useful in large projects (should include graphviz)

```
HAVE_DOT = YES
```

```
GRAPHICAL_HIERARCHY = YES
```

```
CALL_GRAPH = YES
```

```
CALLER_GRAPH = YES
```

[μOS++ Doxygen style guide link](#)

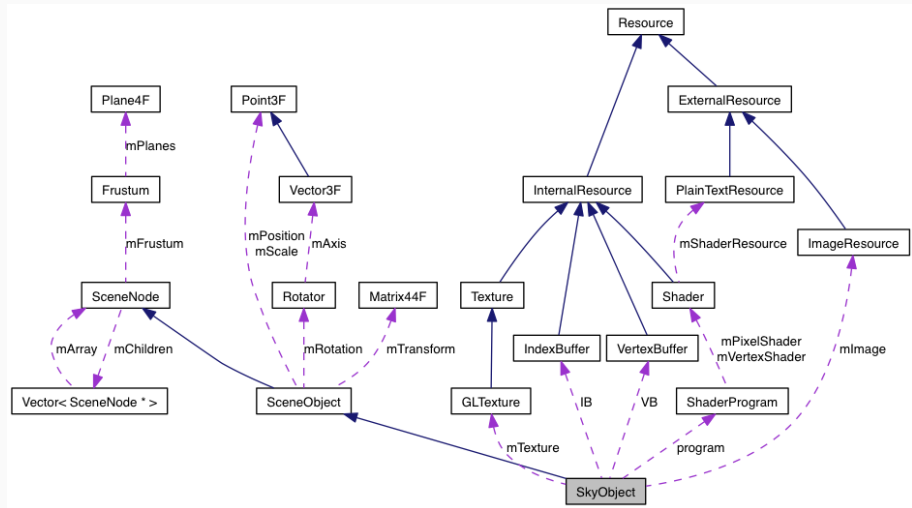

```
/**
 * @copyright MyProject
 * license BSD3, Apache, MIT, etc.
 * @author MySelf
 * @version v3.14159265359
 * @date March, 2018
 * @file
 */

/// @brief Namespace brief
///      description
namespace my_namespace {

/// @brief "Class brief description"
/// @tparam R "Class template for"
template<typename R>
class A {
```

```
/**
 * @brief "What the function does?"
 * @details "Some additional details",
 *          Latex/MathJax:  $\sqrt{a}$ 
 * @tparam T Type of input and output
 * @param[in] input Input array
 * @param[out] output Output array
 * @return `true` if correct,
 *         `false` otherwise
 * @remark it is useful if ...
 * @warning the behavior is undefined if
 *          @p input is `nullptr`
 * @see related_function
 */
template<typename T>
bool my_function(const T* input, T* output);

/// @brief
void related_function;
```

Code Statistics

Count Lines of Code (cloc)

Website: cloc.sourceforge.net

```
$cloc my_project/
```

```
4076 text files.
```

```
3883 unique files.
```

```
1521 files ignored.
```

```
http://cloc.sourceforge.net v 1.50 T=12.0 s (209.2 files/s, 70472.1 lines/s)
```

```
-----
```

Language	files	blank	comment	code
C	135	18718	22862	140483
C/C++ Header	147	7650	12093	44042
Bourne Shell	116	3402	5789	36882

```
-----
```

Features: filter by-file/language, SQL database, archive support, line count diff, etc.

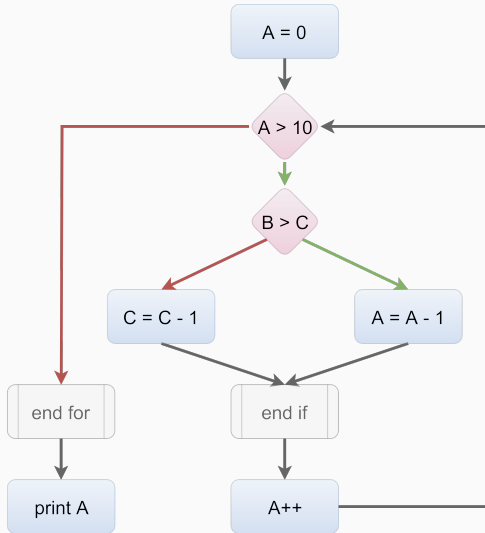

Website: github.com/terryyin/lizard

Cyclomatic Complexity: is a software metric used to indicate the complexity of a program. It is a quantitative measure of the number of linearly independent paths through a program source code

```
$lizard my_project/
```

```
=====
NLOC    CCN  token  param  function@line@file
-----
10      2    29     2     start_new_player@26@./html_game.c
6       1    3      0     set_shutdown_flag@449@./httpd.c
24     3    61     1     server_main@454@./httpd.c
-----
```

- CCN: cyclomatic complexity (should not exceed a threshold)
- NLOC: lines of code without comments
- token: Number of conditional statements
- param: Parameter count of functions

CC	Risk Evaluation
1-10	a simple program, <i>without much risk</i>
11-20	more complex, <i>moderate risk</i>
21-50	complex, <i>high risk</i>
> 50	untestable program, <i>very high risk</i>

CC	Guidelines
1-5	The routine is probably fine
6-10	Start to think about ways to simplify the routine
> 10	Break part of the routine

Risk: Lizard: 15, OCLint: 10

Other Tools

Code Formatting - clang-format

clang-format is a tool to automatically format C/C++ code (and other languages)

Website: clang.llvm.org/docs/ClangFormat.html

```
$ clang-format <file/directory>
```

clang-format searches the configuration file .clang-format file located in the closest parent directory of the input file

clang-format example:

```
IndentWidth: 4
UseTab: Never
BreakBeforeBraces: Linux
ColumnLimit: 80
SortIncludes: true
```

Compiler Explorer (assembly and execution)

Compiler Explorer is an interactive tool that lets you type source code and see assembly output, control flow graph, optimization hint, etc.

Website: godbolt.org

```
C++ source #1 x
A Save/Load + Add new...
1 #include <algorithm>
2
3 int method(int a, int b) {
4     return a + b;
5 }
6
```

```
x86-64 clang 5.0.0 Compiler options...
A 11010 .LX0: .text // \s+ Intel Demangle
1 method(int, int): # @method(int, int)
2     push rbp
3     mov rbp, rsp
4     mov dword ptr [rbp - 4], edi
5     mov dword ptr [rbp - 8], esi
6     mov esi, dword ptr [rbp - 4]
7     add esi, dword ptr [rbp - 8]
8     mov eax, esi
9     pop rbp
10    ret
```

Key feature: support multiple architectures and compilers

CppInsights See what your compiler does behind the scenes

Website: cppinsights.io

Source:

```
1 #include <cstdio>
2 #include <vector>
3
4 int main()
5 {
6     const char arr[10]{2,4,6,8};
7
8     for(const char& c : arr)
9     {
10         printf("c=%c\n", c);
11     }
12 }
```

Insight:

```
1 #include <cstdio>
2 #include <vector>
3
4 int main()
5 {
6     const char arr[10]{2,4,6,8};
7
8     {
9         auto&& __range1 = arr;
10        const char * __begin1 = __range1;
11        const char * __end1 = __range1 + 10;
12
13        for( ; __begin1 != __end1; ++__begin1 )
14        {
15            const char & c = *__begin1;
16            printf("c=%c\n", static_cast<int>(c));
17        }
18    }
19 }
```

TabNine uses deep learning to provide code completion

Website: tabnine.com

Features:

- Project indexing
- Recognize common language patterns
- Use even the documentation to infer this function name, return type, and arguments
- Semantic completion is available through clangd

```
1 import os
2 import sys
3
4 # Count lines of code in the given directory, separated by file extension
5 def main(directory):
6     line_count = {}
7     for filename in os.listdir(directory):
8         _, ext = os.path.splitext(filename)
9         if ext not in line_count:
10            line_count[ext] = 0
11            for line in open(os.path.join(directory, filename)):
12                line_count[ext] += 1
13                line_count[ext] += 1          13%
14                line_count[ext]             Tab 20%
15                line_count[ext] +=         3 14%
16                line_count[ext].append(    4 3%
17                line                        5 23%
```

Ripgrep is a code-searching-oriented tool for regex pattern

Website: github.com/BurntSushi/ripgrep

Features:

- Default recursively searches
- Skip .gitignore patterns, binary and hidden files/directories
- Windows, Linux, Mac OS support
- Up to 100x faster than GNU grep

```

Code Exploration - SourceTrail

SourceTrail is an interactive code explorer that simplifies navigation in complex source code

Website: www.sourcetrail.com/#intro

```
.. TicTacToe::Start
32     return true;
33 }
34
35 void TicTacToe::Run() {
36     field_.Show();
37
38     int playerIndex = 0;
39
40     for ( int i = 0; i < 9; i++ ) {
41         Player& player = *players_[playerIndex];
42
43         field_.MakeMove( player.Turn( field_ ),
44             field_.Show());
45
46         if ( field_.SameInRow( player.getToken()
47             io::stringOut(player.getName());
48             io::stringOut(" won!\n\n");
49             return;
50         )
51     )
52     playerIndex = ( playerIndex + 1 ) % 2;
53 }
54
55 io::stringOut("Game ends in draw!\n\n");
56 }
57
58 void TicTacToe::Reset() {
```

Code Benchmarking - Quick-Bench

Quick-benchmark is a micro benchmarking tool intended to quickly and simply compare the performances of two or more code snippets. The benchmark runs on a pool of AWS machines

Website: quick-bench.com
